

This is a comprehensive and practical clinical pharmacology course with emphasis on the practical tips when answering patients' enquiries on medications. Issues on drug-drug interactions, methods to enhance drug compliance and common misconceptions on drugs will be discussed during the course in an interactive manner. Those aspects are rarely mentioned in standard textbooks. Detailed lecture notes will be distributed in the course.

Nurses or clinic assistants are responsible for dispensing medications but clinical pharmacology hasn't been taught extensively in the nursing curriculum. When patients encounter adverse effects of medications, they usually seek assistance from nurses first instead of doctors. Nowadays, many patients are suffering from a number of chronic medical or psychiatric diseases concurrently, so quite commonly they need to take multiples medications every day. If nurses are better informed of all the important indications, contraindications and adverse effects of all kinds of commonly prescribed medications, they can perform their clinical duties much better. What's more, any health professionals can benefit from this course.

Intensive Course on Commonly Prescribed Medications
